

The Ft Benning Compressed Natural Gas station is a new design based on DOD requirements. It is rapidly deployable, with an installation of less than one week. It is transportable, meaning that the system can be moved based on changing mission. Finally, it is designed to mirror the installation's growing demand. It can start off as a basic system, and grow as their existing legacy fleet are gradually replaced with natural gas driven vehicles. This system was designed to support the bus, car and pickup fleet.
